

IMY 761 Deliverable 5

Thato Kalagobe and Chenoa Perkett

Overview

For this deliverable, you will create the software application that will enable you to conduct your research project (as per Deliverable 3). The purpose of this deliverable is also to motivate how this application you've created allows you to answer your research questions.

Practical instructions

Do not create a new document. Fill everything in on this document and then submit it in a .docx format.

Exercise 1: Updated research questions

Include the most recent versions of your research questions below as well as the purpose of the system in the context of your research.

Primary question: The Effect of Diegetic Versus Non-Diegetic Failure Feedback on Player Frustration and Perceived Competence in a 2D Platformer Game

Sub-question	Source
How do existing definitions distinguish diegetic from non-diegetic game interfaces and feedback?	Literature
How does interface diegesis compare to non-diegesis in terms of its effect on immersion, frustration, and perceived competence, according to existing research?	Literature
How does diegetic failure feedback compare to non-diegetic failure feedback in terms of players' self-reported frustration and perceived competence?	Empirical
How do players' descriptions of failure, competence, and motivation to continue compare between the diegetic and non-diegetic conditions?	Empirical

System purpose:

The purpose of the system is to serve as the experimental instrument through which the study's manipulation is delivered and controlled. It implements a 2D platformer in which failure feedback can be presented either diegetically, through an in-world companion that demonstrates the correct action, or non-diegetically, through HUD text and an overlay arrow. Both conditions are built on a single failure pipeline, so that the two versions differ only in the channel through which corrective information is delivered and not in its content, timing, or

difficulty. Participants then report their feedback via questionnaire and interview, making it the mechanism by which the empirical sub-questions can be answered.

Exercise 2: Video walkthrough

Submit a video where you go through all the functionality of your system step by step. Since this deliverable is the beta version of your application, it needs to be structurally complete in terms of the required platform and functionality, although it might still contain some minor usability issues or software bugs.

You should also explicitly address the role of the system in answering each appropriate research question, i.e., each one answered by the empirical data. After the functionality of the system has been described, go over each sub-question and discuss the role of the system in answering this question (refer to the different roles the system might have from Deliverable 3). After each sub-question has been covered, summarise the role of the system toward answering the main research question.
